

Phase 5: Development

Build the data model, security, automation and AI agent in Salesforce.

5.1 Requirement analysis and planning

- Gather needs from end users and delivery agents; define personas (Customer, Agent, Admin).
- Design the data model with relationships between Parcel, Sender, Receiver and Delivery.
- Select tools: Salesforce Flows, Prompt Builder, AgentForce AI.
- Users: customers/senders, delivery agents, customer support team, admin team, system integrator/developer.

5.2 Data model

Object	Purpose	Key links
Parcel__c	Parcel ID, status, weight, estimated delivery date	Sender, Receiver, Delivery
Delivery__c	Current location, estimated delivery date, linked parcel	Sender, Parcel
Sender__c	Sender address, contact, email	Many parcels
Receiver__c	Receiver address, contact, email	Sender, Parcel

5.3 Security model

- **Role hierarchy:** Administrator, Delivery Manager, Agent, Customer.
- **Admin profile:** full access to all objects and records.
- **Delivery Agent profile:** read/edit on Parcel, Delivery, Sender and Receiver.
- **Customer profile:** read-only access to own parcel details via Experience Cloud.
- **Support Staff profile:** access to Cases and Parcel details.
- **Record-level:** sharing rules on Parcel and Delivery; customers see only records linked to their own Sender or Receiver details.
- **Field-level:** sender email, receiver contact and location coordinates restricted to Admin and Agent profiles.

5.4 Backend and configuration milestones

- 1 **Salesforce account:** sign up at developer.salesforce.com/signup, verify the email, set a password and reach the Setup page.
- 2 **Objects:** in Object Manager create custom objects Parcel, Delivery, Sender and Receiver (record name as text), with Allow Reports, Allow Search and Track Field History enabled.
- 3 **Tabs:** create a custom object tab for each object and keep the default profile settings.
- 4 **Fields and relationships:** Parcel: Parcel ID (auto number P-{000}), Status, Weight, Estimated Delivery Date, Sender lookup. Delivery: Current Location (geolocation), Estimated Delivery, Sender, Parcel. Sender: Sender Address (geolocation), Contact, Email. Receiver: Receiver's Address (geolocation), Contact, Email, Sender, Parcel.

- 5 **Prompt Builder:** create the Flex prompt template Retrieve_Parcel_Details that returns Parcel Name, Parcel ID, Status, Weight and Estimated Delivery Date for a matching Parcel ID. Add the Parcel fields as resources, save and activate.
- 6 **Flow:** create the auto-launched flow Parcel Details with input variable ids (text, available for input) and output variable Output (text, available for output). Save, activate and assign flow access to the required profiles.

Flow: Start -> Get Records (Parcel where Parcel ID = ids) -> Action (Retrieve Parcel Details) -> Assignment (Output = prompt response) -> End

5.5 UI/UX and agent setup

- 1 **Permission set:** create Swift Ship (license: Einstein Agent). On each object enable Read, Create and Edit, and make key fields visible.
- 2 **Agent user:** assign the Swift Ship permission set to the Einstein Service Agent user.
- 3 **Org setup:** enable the Default Agent from Salesforce Go; in Einstein Setup turn on Einstein, Global Languages and Deploy Prompt Template; in AgentForce Agents turn on Agentforce and the Default Agent.
- 4 **Build the agent:** create SwiftShip Tracker in Agentforce Builder and add a Parcel Tracker subagent. Its instructions tell it to extract the Parcel ID from the user's message, pass it into the flow's ids variable, then hand the returned record to the Retrieve Parcel Details action.
- 5 **Actions:** add Retrieve Parcel Details (reference type: Prompt Template) to the subagent, save and activate.
