

Phase 6: Testing and Security Validation

Confirm the agent finds the right topic, runs the flow and returns real parcel data.

Verification steps

- 1 In Setup > Agentforce Agents, confirm the SwiftShip Tracker agent is listed and active.
- 2 Open the Parcel Tracker subagent and confirm its description and linked action.
- 3 In Flows, confirm Parcel Details is active. If data access is restricted, run it in system context without sharing.
- 4 Use Preview to test queries such as "Track parcel ID P12345" or "Update delivery status for parcel P67890 to Delivered."
- 5 Open Parcels from the App Launcher, search the tested ID and check the Status and any flow-created records.

Test evidence

Test record: Parcel "Laptop", ID P-002, status Booked, weight 2, estimated delivery 10/1/2026. The preview routed to the Parcel Tracker subagent and ran the Retrieve Parcel Details action.

Open issue: in the preview screenshot the agent replied that the parcel's name, status, weight and delivery date were missing, although the record has them. Check that Status__c and Weight__c exist with those API names, that the permission set grants access to them, and that the flow's Parcel ID filter matches what the user types. Then re-test.
