

Phase 7: Deployment, Documentation and Maintenance

State what was deployed and how it will be kept healthy.

- Testing was done in the Developer Org to simulate a live setup before any deployment stage.
- Production testing (UAT or sandbox) was not performed: Developer Edition orgs are standalone, and enterprise AgentForce deployment (sandboxes, staging, CI/CD) is outside this academic prototype.

Maintenance, monitoring and troubleshooting

Keep Parcel, Sender, Receiver and Delivery data accurate. Watch for misrouted agent queries, failed Flow executions and slow AgentForce responses. Fix configuration errors, update Flow logic, refine agent topics and improve prompts. In real enterprise deployments these practices keep AI service agents reliable, scalable and aligned with business goals.
